

Grant Portfolio Dashboard — README

Illustrative grant monitoring tool built for the Clean Air Fund India Analyst application

Objective

This workbook demonstrates the grant/programme monitoring skill set called for in the Analyst role — budget tracking, disbursement monitoring, risk and reporting oversight, and portfolio-level reporting — applied to a mock India air quality grant portfolio. It was built independently, outside of any employment or contract, specifically as a work sample for this application.

Data Assumptions

- All grant names, partner organisation types, budgets, disbursement figures, dates and statuses are **illustrative** and were constructed for demonstration purposes.
- Partner organisation types (e.g. Research Institute, State Pollution Control Board, Urban Local Body, Public Health Foundation, Civil Society Organisation) reflect realistic categories of implementing partners in the Indian clean air ecosystem, not real named entities with confirmed CAF grants.
- Budget scale (■12 lakh – ■68 lakh per grant) is loosely consistent with publicly reported ranges for India-focused clean air philanthropic funding, chosen so the figures read as plausible rather than arbitrary.
- No confidential, proprietary, or actual Clean Air Fund data was used or referenced at any point.

Dashboard Features

Sheet	Contents
Executive Summary	Auto-generated portfolio narrative and key figures, formula-driven from the tracker
Dashboard	KPI cards, 5 charts (budget vs. disbursed, status, risk, utilisation, health score), reporting calendar
Grant Tracker	21-field tracker: budget, disbursement, variance vs. time-elapsed burn rate, timeline, health score
Finance & Deliverables	Payment request/approval/invoice tracking and deliverable completion by grant

Skills Demonstrated

- Grant/budget tracking and disbursement monitoring across a multi-grant portfolio
- Variance analysis: comparing actual disbursement against a time-elapsed burn-rate benchmark
- Composite performance metric design (Health Score synthesising status, risk, and reporting timeliness)
- Dashboard and data visualisation for a non-technical, time-constrained reviewer audience
- Structured payment and deliverable tracking consistent with funder reporting requirements

Key Insights (from the illustrative data)

- Portfolio-wide utilisation sits at 47%, with wide variation by grant — from a fully disbursed, completed grant to one at just 3% utilisation.
- One grant (Community Awareness Campaign) is flagged high-risk: a missed milestone combined with an overdue report drags its Health Score to 30 (Red), signalling it needs immediate management attention.
- The City Emissions Programme's disbursement is running behind its time-elapsed benchmark, a variance that would be invisible on a simple % Utilised figure but is surfaced by comparing spend to schedule.
